A44308
Antho-RPamide precursor - sea anemone (Anthopleura elegantissima)
C;Species: Anthopleura elegantissima
C;Date: 10-Jun-1993 #sequence_revision 18-Nov-1994 #text_change 09-Jul-2004
C;Accession: A44308
R;Schmutzler, C.; Darmer, D.; Diekhoff, D.; Grimmelikhuijzen, C.J.
J. Biol. Chem. 267, 22534-22541, 1992
A;Title: Identification of a novel type of processing sites in the precursor for the sea A;Reference number: A44308; MUID:93054550; PMID:1429603
A;Accession: A44308
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 2

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBCELLULAR LOCATION: Secreted.
SIMILARITY: Belongs to the FARP (FMRFamide related peptide) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sea anemones.",

protein, modules. New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding

Claim 7; Page 16; 18pp; German.

XAXEXEXXXXXXXEFFXEXEXEXEXEXEXEXEXEXEXEX The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides atronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it

```
The invention relates to an isolated peptide (I) comprising at least two conditions in the containing at conditions and individual modules separated by 0-50 amino acids, with each containing at conditions one mostif His-Pro-X where X = Gln, Asn or Met. (I), which contain the conditions of the contain the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of attached proteins (II) (so it conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the condition in the conditions of the conditions of the conditions of the condition in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3888888888

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 35

                                                                                                                                                                                                                     The invention relates to an isolated peptide (I) comprising at least two conditions individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain C streptavidin binding modules, are useful as affinity handles for C e.g. on protein chips or microtitre plates. The modules in (I) bind C strongly to streptavidin, with a co-operative effect that provides CC stronger binding than a single tag, but are displaced by a competitor. (C may not be essential to remove it); facilitates detection and has easily C controllable binding properties. (I) is particularly used for purifying C FP from dilute solution in batch formats (which use simpler apparatus CC than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         문

                                                                                                                                                                                                                 The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion protein (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention

New biologically-active aggrecanase protein having a deletion of all, a portion of a TSP domain, useful for treating osteoarthritis, cancer. Parkinson's disease, coronary thrombosis, Alzheimer's disease and multiple sclerosis. cancer, or

Disclosure; Fig 15; 111pp; English.

This invention relates to novel truncated human aggrecanase proteins and component of mucleotide sequences. Aggrecan is a major extracellular component of carticular cartilage. It is a proteoglycan responsible for providing contribution of the cartilage with its mechanical properties of compressibility and celasticity. The loss of aggrecan has been implicated in the degredation of articular cartilage in arthritic diseases such as osteoarthritis.

CC Aggrecanase is responsible for the cleavage of aggrecan, thereby having a color in cartilage degradation associated with osteoarthritis and confident of the current invention are truncated aggrecanase-1 (ADAMTS-4) and aggrecanase-2 (ADAMTS-5) enzymes which have at least one thrombospondin (TSP) domain deleted. These are composited their full-length counterparts. The proteins of the invention may be of cuse in the development of compounds with osteopathic, antiarthritic, cortostatic, antiinfammatory, antirheuratic, ophthalmological, antirocomic antiarthritic, antiinfammatory, antirheuratic, ophthalmological. thrombolytic, vasotropic, antimicrobial, respiratory-gen, nootropic, neuroprotective, antiparkinsonian or immunosuppressive activities through neuroprotective, antiparkinsonian or immunosuppressive activities through aggrecanase inhibition. The proteins of the invention may therefore be useful for the manufacture of compositions for the treatment of aggrecanase-associated conditions, such as osteoarthritis, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, corneal ulceration, coronary thrombosis, Crohi's disease, emphysema, the corneal ulceration, coronary thrombosis, Crohi's disease, emphysema, the corneal ulceration, coronary thrombosis, Crohi's disease, emphysema, the corneal ulceration, coronary thrombosis, Crohi's disease, emphysema, the corneal ulceration of the corneal ulceration of the corneal ulceration. Alzheimer's disease, Parkinson's disease, multiple sclerosis and aortic aneurysm. The present sequence is the amino acid sequence of a recombinant truncated aggrecanase 2 (ADAMTS-5) enzyme of the invention with a peptide linker and a streptavidin tag. and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The
                                                                                            Claim 9;
                                                                                                                      New isolated, modified ADAMTS4 (aggrecanase) stability useful for identifying inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADAMTS4; a disintegrin-like and metalloprotease; thrombospondin type I motif 4; reprolysin; zinc metalloprotease; aggrecanase; osteopathic; antiinflammatory antiarthritic; antircytostatic; osteopathic; glioma; cancer; inflammatory joint; rheumatoid arthritis; septic arthritis; periodontal; Crohn's dig

The current sequence is that of the furin-processed human aggrecanase ADAMTS4 truncated protein with Strep tag of the invention.

ADAWTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the human aggrecanase ADAWTS4 truncated protein with Strep tag of the invention.
                                                                                                                                                                                                                                                                             Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                   Misc-difference

Vaccines that contain CbpG, its N- truncated version or nucleic acid encoding them are useful for preventing infection by bacteria that express CbpG, specifically Streptococcus pneumoniae and in inducing an immune response. Compositions that contain CbpG or antibodies specific for it are useful for treating such infections. Antibodies are also useful for diagnostic detection of CbpG and oligonucleotides that hybridise to CbpG DNA are used to detect CbpG-expressing bacteria. CbpG DNA are used for recombinant production of CbpG and their fragments. The present sequence is Pneumococcus sp. CbpA protein. (Updated on 06-AUG-2003 to correct OS field.)
             Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel chimeric nucleic acid (I), encoding a CC potassium channel subunit (II) derived from Streptomyces lividans KCsA CC and human KV1.3. The chimeric (bacterial-human) potassium channels are CC useful, after fixing to a carrier, for identifying compounds that bind to the chimeras or modify their activity, i.e. compounds that are toxic or compounds that are toxic or contentially useful therapeutically, by acting as potassium channel CC antagonist or agonist, in treatment of circulatory or nervous system CC disorders, urinary incontinence, tumours, or inflammation, in human or continery medicine. Chimeric channels encoded by (I) can be immobilized, cetive and functional form, and membranes by protein chip CC technology. The channels can be isolated from recombinant bacteria in CC weeks or months, during which time they can be used many times. This confidence represents ChiVI subunit used in the construction of the chimeric potassium channels described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

CC This invention describes a novel chimeric nucleic acid (I), encoding a CC potassium channel subunit (II) derived from Streptomyces lividans KCsA CC and human KV.13. The chimeric (bacterial-human) potassium channels are CC useful, after fixing to a carrier, for identifying compounds that bind to the chimeras or modify their activity, i.e. compounds that are toxic or CC potentially useful therapeutically, by acting as potassium channel CC antagonist or agonist, in treatment of circulatory or nervous system CC disorders, urinary incontinence, tumours, or inflammation, in human or CC veterinary medicine. Chimeric channels encoded by (I) can be immobilized, CC as an array, on a carrier, making possible screening by protein chip CC as an array, on a carrier, making possible screening by protein chip CC technology. The channels can be isolated from recombinant bacteria in CC weeks or months, during which then they can be used many times. This CC sequence represents the ChivII subunit used in the construction of the CC chimeric potassium channels described in the invention
Sequence 183 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding chimeric potassium channel protein, useful, when immobilized on carrier, in screening agents for toxicity and pharmaceutical activity.
                                                                                                                                                                                                                                                                                                                                                                                                              Example 1; Page 16; 34pp; German.

The chimeric (bacterial-human) potassium channels are useful, after fixing to a carrier, for identifying compounds that bind to the chimeras or modify their activity, i.e. compounds that are toxic or potentially useful therapeutically, by acting as potassium channel antagonist or agonist, in treatment of circulatory or nervous system disorders, urinary incontinence, tumours, or inflammation, in human or veterinary medicine. Chimeric channels encoded by (I) can be immobilized, as an array, on a carrier, making possible screening by protein chip technology. The channels can be isolated from recombinant bacteria in stable, active and functional form, and membranes are stable for many weeks or months, during which time they can be used many times. This sequence represents the ChiI subunit used in the construction of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disorders, urinary incontinence, tumours, or inflammation, in human or veterinary medicine. Chimeric channels encoded by (I) can be immobilized, as an array, on a carrier, making possible screening by protein chip technology. The channels can be isolated from recombinant bacteria in stable, active and functional form, and membranes are stable for many weeks or months, during which time they can be used many times. This sequence represents the ChirV subunit used in the construction of the chimeric potassium channels described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel chimeric nucleic acid (I), encoding a potassium channel subunit (II) derived from Streptomyces lividans KcsA and human Kvl.3. The chimeric (bacterial-human) potassium channels are useful, after fixing to a carrier, for identifying compounds that bind the chimeras or modify their activity, i.e. compounds that are toxic of potentially useful therapeutically, by acting as potassium channel antagonist or agonist, in treatment of circulatory or nervous system
                                                                                    New nucleic acid encoding chimeric potassi when immobilized on carrier, in screening pharmaceutical activity.
                                                                                                                                                                                                                                                                                                                                                                                        Key Location/Qualifiers Misc-difference 181
                                                                                                                                                                                                                                                                                                                                                                                                                                     Symthetic.

This invention describes a novel chimeric nucleic acid (I), encoding a potassium channel subunit (II) derived from Streptomyces lividans KcsA and human Kv1.3. The chimeric (bacterial-human) potassium channels are useful, after fixing to a carrier, for identifying compounds that bind to the chimeras or modify their activity, i.e. compounds that are toxic or potentially useful therapeutically, by acting as potassium channel arragonist or agonist, in treatment of circulatory or nervous system disorders, urinary incontinence, tumours, or inflammation, in human or veterinary medicine. Chimeric channels encoded by (I) can be immobilized, as an array, on a carrier, making possible screening by protein chip
                                                                                                                                                                                                                                                                                          Example 1; Page 16; 34pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Potassium channel; chimeric; KcsA; Kv3.1; agonist; antagonist; tumou circulatory disorder; nervous system disorder; urinary incontinence; inflammation; protein chip; screening; ChiVIII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  useful, after fixing to a carrier, for identifying compounds that bind to the chimeras or modify their activity, i.e. compounds that are toxic or potentially useful therapeutically, by acting as potassium channel antigonist or agonist, in treatment of circulatory or nervous system disorders, urinary incontinence, tumours, or inflammation, in human or as an array, on a carrier, making possible screening by protein chip technology. The channels can be isolated from recombinant bacteria in stable, active and functional form, and membranes are stable for many sequence represents the Chilx subunit used in the construction of the chimeric potassium channels described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric potassium channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAG80262 standard; protein; 183

                            This invention describes a novel chimeric nucleic acid (I), encoding a C potassium channel subunit (II) derived from Streptomyces lividans KCSA CC and human KV1.3. The chimeric (bacterial-human) potassium channels are CC useful, after fixing to a carrier, for identifying compounds that bind to the chimeras or modify their activity, i.e. compounds that are toxic or CC potentially useful therapeutically, by acting as potassium channel contagonist or agonist, in treatment of circulatory or nervous system CC disorders, urinary incontinence, tumours, or inflammation, in human or CC veterinary medicine. Chimeric channels encoded by (I) can be ismobilized, CC as an array, on a carrier, making possible screening by protein chip CC technology. The channels can be isolated from recombinant bacteria in CC stable, active and functional form, and membranes are stable for many CC weeks or months, during which time they can be used many times. This CC sequence represents the Chix subunit used in the construction of the CC chimeric potassium channels described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18-FEB-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                technology. The channels can be isolated from recombinant bacteri stable, active and functional form, and membranes are stable for weeks or months, during which time they can be used many times. T sequence represents the ChiVIII subunit used in the construction chimeric potassium channels described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAG80264 standard;

Sequence 10, Application US/10026578B Publication No. US20030083474A1

GENERAL INFORMATION:

```
APPLICANT: IBA (GmbH)
APPLICANT: Schmidt, Thomas
TITLE OF INVENTION: Sequentially Arranged Streptavidin-Binding Modules as Affinity Ta
FILE REFERENCE: 100810.01US1
CURRENT REFERENCE: 100810.01US1
CURRENT FILING DATE: 2002-11-11
PRIOR APPLICATION NUMBER: DE 101 13 776.1
PRIOR APPLICATION NUMBER: DE 101 13 776.1
PRIOR APPLICATION NUMBER: PCT/EP01/11846
PRIOR PILING DATE: 2001-0-12
NUMBER OF SEQ ID NOS: 14
SEQ ID NOS: 14
SEQ ID NOS: 14
SEQ ID NOS: 14
SEQ ID NO 10
LENGTH: 36
TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
COTHER INFORMATION: Synthetic Peptide
FEATURE:
NAME/KEY: MISC FEATURE
LOCATION: (9). - (28)
COTHER INFORMATION: a represents a single amino acid at each of the positions indicat OTHER INFORMATION: missing, the total numbers of x will be no less than 5
PRATURE: NAME/KEY: misc feature
OTHER INFORMATION: Artificial Sequence represents peptide binding module

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

US-09-977-137A-12
Sequence 6, Application US/09977137A
Patent No. 6750042
GEMERAL INFORMATION:
APPLICANT: Summers, Anne O.
APPLICANT: Caguiat, Jonathan
TITLE OF INVENTION: Metal Binding Proteins, Recombinant Host Cells.
TITLE OF INVENTION: Methods
FILE REFERENCE: 79-00
CURRENT APPLICATION UNMBER: US/09/977,137A
CURRENT FILING DATE: 2001-10-12
PRIOR APPLICATION NUMBER: US 60/240,465
PRIOR FILING DATE: 2001-10-12
PRIOR FILING DATE: 2001-10-12
PRIOR FILING DATE: 2001-10-12

Patent No. 6703491

GENERAL INFORMATION:
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: Patentin Ver. 2.0
